

Python markdown

This is a demo Python script that runs from R Markdown.

- It takes 3 files with world population data (happiness index, GDP per capita, corruption index, etc) for 2015, 2016 and 2017
- Cleans data and makes it internally consistent
- Saves clean data file as 'happiness_data.csv'
- Aggregates average GDP per capita and happiness index and groups is by region
- Creates and saves graphs
- Creates a markdown *.html file
